%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
% ENGR 132
% Program Description
%     Allows a user to predict temperature anomaly when given year.
%     The script loads data, constructs the model, displays the
%     regression information in text and in a plot
%
%
% Assignment Information
%   Assignment:      PS 04, Problem 2
%   Author:         Yuefan Fu, ful94@purdue.edu
%   Team ID:        001-05
%   Contributor:     Name, login@purdue [repeat for each]
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

---

## INITIALIZATION

---

```
%import all the data needed from txt file
allData=importdata('Data_global_temp_anomalies.txt','\t');
year=allData.data(:,1);
temperatureAnomaly=allData.data(:,2);
```

---

## CALCULATIONS

---

```
%calculate the coefficient a,b for y=a*x+b
result=polyfit(year,temperatureAnomaly,1);
%calculate SSE and SST
SST=sum((temperatureAnomaly-mean(temperatureAnomaly)).^2);
SSE=sum((temperatureAnomaly-result(1)*year-result(2)).^2);
%calculate R^2
rSquare=1-SSE/SST;
```

---

## FORMATTED TEXT & FIGURE DISPLAYS

```
fprintf('The equation is temperatureAnomal = %.4f year %.4f.\n',result);  
fprintf('SST  %.4f\nSSE = %.4f\nR^2= %.4f\n',SST,SSE,rSquare);  
%plot raw data;  
plot(year,temperatureAnomaly,'x');  
hold on;  
%plot regression line  
plot(year,year*result(1)+result(2));  
legend('raw data','regression line')  
xlabel('year(year)');  
ylabel('temperature Anomaly(C)');  
title('temperatureAnomaly change during 1980 to 2016');
```

The equation is temperatureAnomal = 0.0173 year -34.0936.  
SST 1.4114  
SSE = 0.2810  
R^2= 0.8009

## ANALYSIS

### -- Q1

The excel and matlab use the same method to get a best fit linear regression so they have the same result.

## ACADEMIC INTEGRITY STATEMENT

I/We have not used source code obtained from any other unauthorized source, either modified or unmodified. Neither have I/we provided access to my/our code to another. The project I/we am/are submitting is my/our own original work.
